data_cleaning

May 3, 2025

1 Data Cleaning Exercise

Cleaning your data is crucial when starting a new data engineering project because it ensures the accuracy, consistency, and reliability of the dataset. Dirty data, which may include duplicates, missing values, and errors, can lead to incorrect analysis and insights, ultimately affecting the decision-making process. Data cleaning helps in identifying and rectifying these issues, providing a solid foundation for building effective data models and analytics. Additionally, clean data improves the performance of algorithms and enhances the overall efficiency of the project, leading to more trustworthy and actionable results.

Use Python, `numpy`, `pandas` and/or `matplotlib` to analyse and clean your batch data:

1.1 Import Libraries

[30]:
```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
```

1.2 Load Data

Link to data source: https://www.kaggle.com/datasets/kaushiksuresh147/bitcoin-tweets?resource=download&select=Bitcoin_tweets_dataset_2.csv

[17]:
```
df = pd.read_csv(
    'Bitcoin_tweets_dataset_2.csv',
    sep=',',
    on_bad_lines='skip',
    engine='python',
    encoding='utf-8'
)
```

1.3 Understand the Data

View the first few rows, get summary statistics and check data types

[7]:
```
df.head()
```

[7]:
```
        user_name   user_location  \
0        ChefSam  Sunshine State
1            Roy             NaN

174159          None  None  None     None   None        NaN

[1060 rows x 13 columns]
```

[19]:
```
df.duplicated().sum()
```

[19]:
```
1060
```

[20]:
```
df = df.drop_duplicates()
```

[21]:
```
df.duplicated().sum()
```

[21]:
```
0
```

1.6 Handle Outliers

Identify outliers and remove or correct them

[22]:
```
df.select_dtypes(include='number').columns
```

[22]:
```
Index(['user_followers', 'user_friends'], dtype='object')
```

[24]:
```
numeric_df = df.select_dtypes(include='number')

Q1 = numeric_df.quantile(0.25)
Q3 = numeric_df.quantile(0.75)
IQR = Q3 - Q1

condition = ~((numeric_df < (Q1 - 1.5 * IQR)) | (numeric_df > (Q3 + 1.5 *␣
 ↪IQR))).any(axis=1)

df_no_outliers = df[condition]
```

[25]:
```
print(f"Vorher: {len(df)} Zeilen")
print(f"Nachher: {len(df_no_outliers)} Zeilen")
```

```
Vorher: 173337 Zeilen
Nachher: 134832 Zeilen
```

1.7 Handle Incorrect Data Types

[26]:
```
df.dtypes
```

[26]:
```
user_name            object
user_location        object
user_description     object
user_created         object
user_followers      float64
user_friends        float64
user_favourites      object
user_verified        object
date                 object
text                 object
hashtags             object
source               object
is_retweet           object
dtype: object
```

[27]:
```
for col in df.select_dtypes(include='object'):
    try:
        df[col] = pd.to_numeric(df[col])
        print(f"Konvertiert: {col} → numerisch")
    except:
        try:
            df[col] = pd.to_datetime(df[col])
            print(f"Konvertiert: {col} → datetime")
        except:
            print(f"Unverändert: {col}")
```

```
/tmp/ipykernel_1412/1078092930.py:7: UserWarning: Could not infer format, so
each element will be parsed individually, falling back to `dateutil`. To ensure
parsing is consistent and as-expected, please specify a format.
  df[col] = pd.to_datetime(df[col])

  df[col] = pd.to_datetime(df[col])
```

```
Unverändert: user_name
Unverändert: user_location
Unverändert: user_description
Unverändert: user_created
Unverändert: user_favourites
Unverändert: user_verified
Unverändert: date
Unverändert: text
Unverändert: hashtags
Unverändert: source
Konvertiert: is_retweet → numerisch
```

[28]:
```
df['date'] = pd.to_datetime(df['date'], format='%Y-%m-%d %H:%M:%S',␣
↪errors='coerce')
```

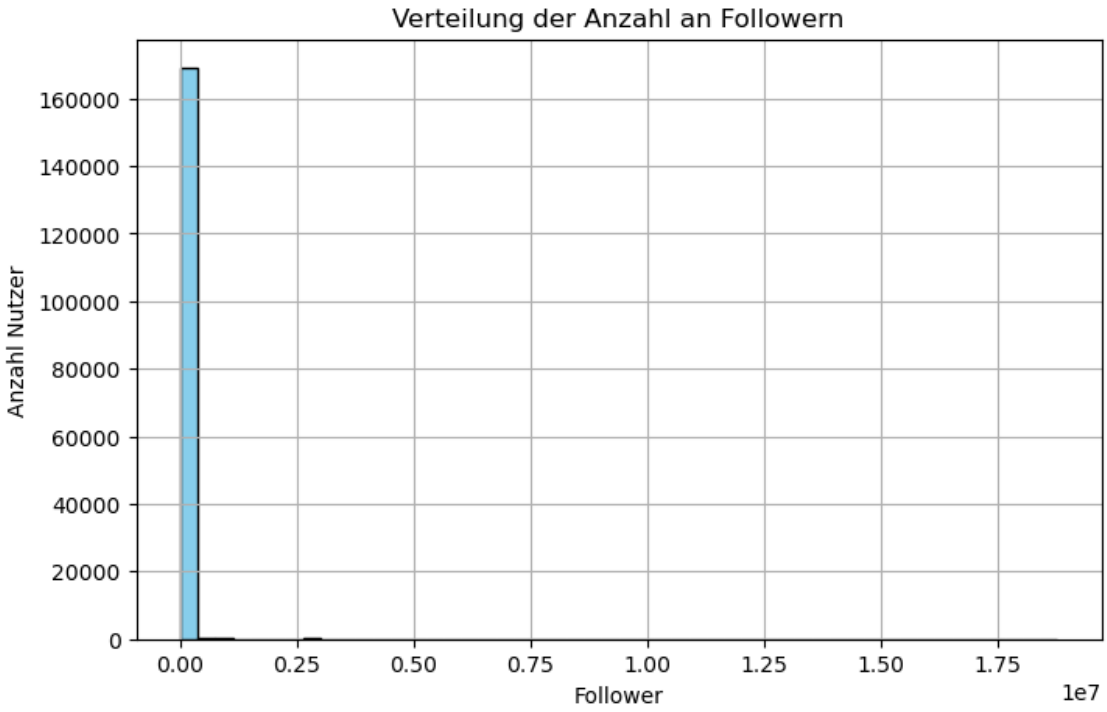
[32]:
```
df['is_retweet'] = df['is_retweet'].map({'True': 1, 'False': 0})
```

1.8 Visualize Data

Use graphes, plots and/or diagrams to visualize the data

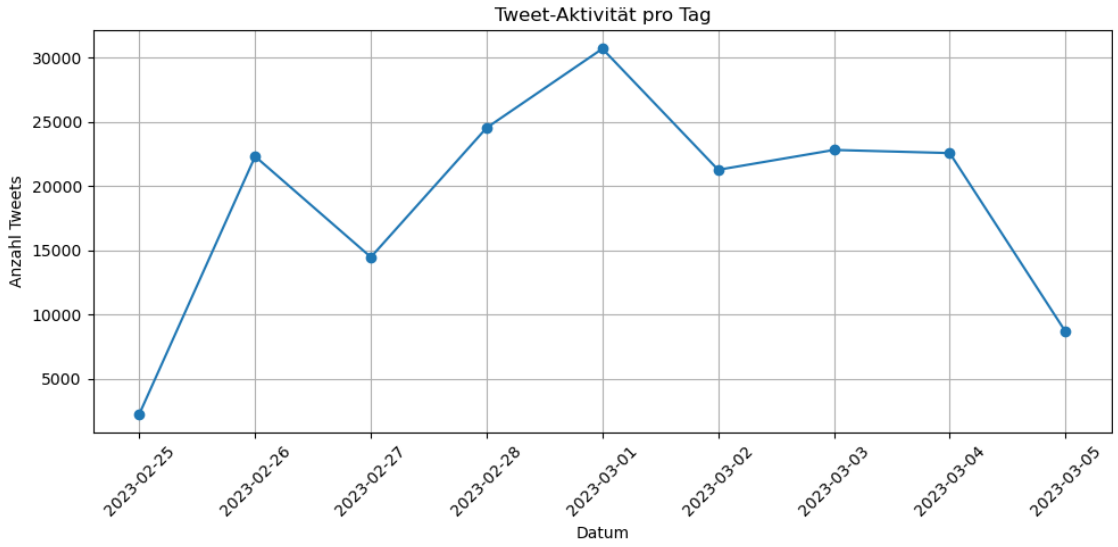
[36]:
```
plt.figure(figsize=(8, 5))
plt.hist(df['user_followers'], bins=50, color='skyblue', edgecolor='black')
plt.title('Verteilung der Anzahl an Followern')
plt.xlabel('Follower')
plt.ylabel('Anzahl Nutzer')
plt.grid(True)
```

```
plt.show()
```

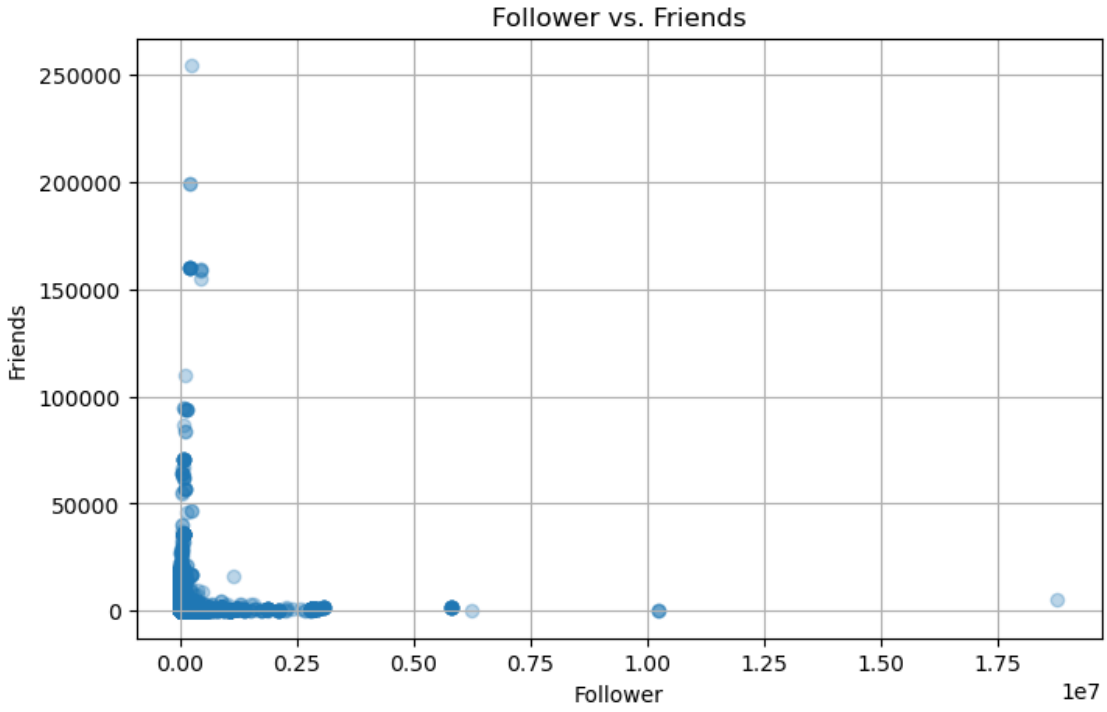


[37]:
```
tweets_per_day = df['date'].dt.date.value_counts().sort_index()

plt.figure(figsize=(10, 5))
plt.plot(tweets_per_day.index, tweets_per_day.values, marker='o', linestyle='-')
plt.title('Tweet-Aktivität pro Tag')
plt.xlabel('Datum')
plt.ylabel('Anzahl Tweets')
plt.xticks(rotation=45)
plt.tight_layout()
plt.grid(True)
plt.show()
```



[38]:
```
plt.figure(figsize=(8, 5))
plt.scatter(df['user_followers'], df['user_friends'], alpha=0.3)
plt.title('Follower vs. Friends')
plt.xlabel('Follower')
plt.ylabel('Friends')
plt.grid(True)
plt.show()
```



1.9 Save Cleaned Data

[40]:
```
save_path = "bitcoin_tweets_cleaned.csv"

df.to_csv(save_path, index=False)

print(f"Gespeicherte Datei: {save_path}")
```

```
Gespeicherte Datei: bitcoin_tweets_cleaned.csv
```
