

Spark Exercise

Apache Spark is an excellent tool for data engineering projects due to its robust ability to process large-scale data efficiently through distributed computing. Spark's in-memory processing capabilities significantly enhance the speed of data operations, making it ideal for handling big data workloads. It supports various data sources and formats, offering versatility in data ingestion and transformation. Additionally, Spark's rich API supports multiple programming languages such as Python, Java, and Scala, catering to diverse developer preferences. Its ecosystem, which includes libraries for SQL, machine learning, and graph processing, provides a comprehensive suite for building complex data pipelines and analytics, making it a powerful and flexible choice for data engineering tasks.

Use Python, `pyspark` and `pandas` to explore Apache Spark RDD and DataFrame:

Spark RDD

Spark RDD (Resilient Distributed Dataset) is a fundamental data structure in Apache Spark that enables fault-tolerant, distributed processing of large datasets across multiple nodes in a cluster. Spark RDDs provide a higher-level abstraction for performing distributed data processing tasks, including both map (transformations) and reduce (aggregations) operations.

Import Necessary Libraries

```
In [1]: from pyspark import SparkConf, SparkContext
        from pyspark.sql import SparkSession
        import pandas as pd
```

Spark Context and Session

Initialize Spark Context and Spark Session

```
In [2]: spark = (
        SparkSession
        .builder
        .appName("LoadClosingOddsRDD")
        .config("spark.master", "local[*]")
        .getOrCreate()
        )

sc = spark.sparkContext
```

```
Setting default log level to "WARN".
To adjust logging level use sc.setLogLevel(newLevel). For SparkR, use setLogLevel(newLevel).

Load Data into RDD

```
In [3]: csv_path = "closing_odds.csv"
df = pd.read_csv(
    csv_path,
    compression="gzip",
    encoding="utf-8",
)

data_tuples = list(df.itertuples(index=False, name=None))

rdd = sc.parallelize(data_tuples)
```

Map Operation

Split data into individual parts and create key-value pairs

```
In [4]: rdd_kv = rdd.map(lambda tup: (tup[0], tup[1:]))
print("key-value pairs:")
for kv in rdd_kv.take(5):
    print(kv)
```

key-value pairs:

Spark DataFrame

Spark DataFrame is a distributed collection of data organized into named columns, designed for efficient data manipulation and analysis in Apache Spark. It is used for various data processing tasks such as data ingestion, transformation, querying, and

analysis in Apache Spark, providing a high-level abstraction that simplifies working with structured data.

Load Data into DataFrame

```
In [16]: df = spark.read.format("csv") \
        .option("header", "true") \
        .option("inferSchema", "true") \
        .option("compression", "gzip") \
        .load("./closing_odds.csv.gz")
```

View DataFrame Schema

```
In [17]: df.printSchema()
```

```
